* NOTE: This is a 'working draft' sequence. It currently consists of 196 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as * runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence * as soon as it is available and the accession number will * be preserved.

                                                                                 * NOTE: This record contains 8 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
* be preserved.

Submitted (10-JAN-2000) Production Sequencing Facility, DOE Joint
Genome Institute, 2800 Mitchell Drive, Malnut Creek, CA 94598, USA
On Feb 16, 2000 this sequence version replaced gi:6686434.
* NOTE: This record contains 244 individual
* sequencing reads that have not been assembled into
* contigs. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low-pass sequence sampling is useful for
* identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
* the record is updated, the accession number will
                                                                                                                                                                                                                                                                           gap of unknown length

            Novel Escherichia bacterium having enhanced L-threonine resistance due to enhanced Rhtc protein activity, used to produce L-threonine, L-homoserine, L-valine and L-leucine -
                                                                                   The present sequence is the L-threonine resistance gene, rhtC, from Escherichia coli. This sequence may be used to impart L-threonine resistance on E. coli bacteria, which would be useful for producing a high yield of L-threonine. L-threonine resistance means that the bacteria will be able to grow on a minimal medium containing L-threonine at a concentration at which the corresponding wild-type strain would not grow. Since the transformed bacteria can grow on the minimal medium, it can synthesise L-threonine, which accumulates. The accumulated amino acids can then be removed from the culture medium. The bacterium of the present invention may also be used to synthesise L-homoserine, L-valine and L-leucine at increased levels.
                                                                                                                                                                                                                                                                                                                                                                                                                                           180

The present sequence is the yahN gene (an excretion protein gene) of Escherichia coli. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in lysine, glutamic acid and proline is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.
                                                                                                                                                                                                                                                                                                                                                                                                                                         production of L-amino acids by an Escherichia bacterium increasing the expression amount of an L-amino acid excretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    tgttcgtgattactttttttaatccgggagccaatctctttgtggtagtacaaaccagcc 136

```
This sequence represents a Stealth virus nucleic acid clone. The invention relates to a method of detecting and characterising a stealth virus by reacting a sample suspected of containing a stealth virus with a probe from a known stealth virus and sequencing the resultant isolated nucleotide. The method comprises the steps of: (a) isolating DNA or RNA containing a stealth virus, e.g. a culture of cells showing a viral cytopathic effect; (b) testing the reactivity of the isolated DNA or RNA with a molecular probe that contains at least 18 corn more contiguous nucleotides identical to sequence previously identified from a stealth virus; and, optionally (c) sequencing the isolated DNA or RNA which a molecular probe that method is used to detect stealth virus in a biological product, food or in the environment. The method is also used to evaluate agents for their cinhibitory or stimulatory effects on stealth virus replication and to cherential capacity of the virus to recombine with and potentially alter the nucleic acid sequences of a cell or bacterium.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ó

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is the yeaS gene (an excretion protein gene) of Scherichia coli. The amino acid excretion protein produced from this gene is involved in the production of amino acids, and an increase in its expression leads to an increased accumulation of amino acids in the cell. In this case, an increase in lysine, alamine, valine, histidine, isolaucine, glutamic acid and proline is achieved if multiple copies of the gene are transfected into a bacterium. The bacterium used is E. coli.
                                                                                                                                                                                                                                                                                                Increased production of L-amino acids by an Escherichia bacterium comprises increasing the expression amount of an L-amino acid excretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       318 cgagctggcgaaaagtgggcgcagtttcctgaaaggtttactgaccaatctcgctaatcc 377

This sequence represents a gene encoding a subunit of the cellulose synthase complex of Vigna angularis. The invention relates to subunits of cellulose synthetic equipment, that can be used to increase the amount of cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9728 AYDACYDAYDANCYSSDSTYTBYCSRRCCCYYDAYSCSRYDARCYDACYSYSNSTCYDAT 9669

Agrobacterium vitis Pypersensitivity response (HR) elicitor proteins advances elections that is a rapid, localised necrosis that is associated with the active defence of plants against many pathogens, and occurs when a pathogenic organism interacts with a nonhost plant (i.e. one in which intracellular bacterial growth and disease development do not occur). Like other HR elicitors, the A. vitis elicitor functions in non-host plants by causing a rapid hypersensitive response that results in walling-off and killing of the pathogen. On grape plants, the A. vitis in walling-off and killing of the pathogen. On grape plants, the A. vitis of plant cells and induction of pathogen resistence. A. vitis HR elicitor proteins, in non-infectious form, are used to treat plants or their seeds to proteins, in non-infectious form, are used to treat plants or their seeds to proteins, in non-infectious form, as those caused by fund, bacteria or viruses; and to enhance growth, e.g., to increase yield or to provide earlier germination or maturation. The proteins can also be used to cold, and to improve nutritional value, e.g., altered oll content. The same effects can be produced by producing transgenic plants or seeds by incorporation of DNA that encodes A. vitis HR elicitor proteins. Use of A. vitis HR elicitor proteins, or nucleic acids encoding them, may allow control of previously untreatable diseases; provide systemic treatment; and the proteins of previously untreatable diseases; provide systemic treatment; and the proteins of previously untreatable diseases; provide systemic treatment;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ;

Grobacterium vitis hypersensitivity response (HR) elicitor proteins associated with the active defence of plants against many pathogens, and occurs when a pathogenic organism interacts with a nonhost plant is associated with the active defence of plants against many pathogens, and occurs when a pathogenic organism interacts with a nonhost plant (1.e. one in which intracellular bacterial growth and disease development do not cocur). Like other HR elicitors, the A. vitis elicitor intercoins in non-host plants by causing a rapid hypersensitive response that results in walling-off and killing of the pathogen. On grape plants, the A. vitis elicitor induces a restricted necrosis of tissues, resulting in the death of plant cells and induction of pathogen resistance. A. vitis HR elicitor proteins, in non-infectious form, are used to treat plants or their seeds to impart resistance to disease, such as those caused by fund; bacteria or viruses; and to enhance growth, es, to increase yield or to provide carrier germination or maturation. The proteins can also be used to cold, and to improve nutritional value, e.g., altered oil content. The same effects can be produced by producing transgenic plants or seeds by incorporation of DNA that encodes A. vitis HR elicitor proteins. Use of A. vitis HR elicitor proteins, or nucleic acids encoding them, may allow control of previously untreatable diseases; provide systemic treatment; and elliminate the need for biological control agents or polluting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New protein from Agrobacterium vitis, useful e.g. for imparting resistance to disease or stress to plants, is involved in production of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         992 tggccgttctcagccccggcgcggattttgccatggtgtcgcgcaatagttttctttatg 1051

This genomic DNA sequence encodes insecticidal toxin protein Teah (see W17888-89) of Photorhabdus luminescens, a component of a toxin protein complex. Claimed toxins of P. luminescens (see W17811, w17884-89, W17899-900, W18301-06) can be produced by recombinant DNA methods and applied to, or genetically engineered into, insect larvae food and plants for insect control. The photorhabdus toxins are particularly effective against Southern corn rootworm, Colorado potato beetle, Western corn rootworm, meal worm, boll weevil and turf grub (Coleoptera), beet armyworm, black cutworm, cabbage looper, codling moth, corn earnyworm, black borer, tobacco hornworm and tobacco budworm (Lepidoptera), and are also active against insects of the orders Hymenoptera, piptera, Dictyoptera, Acarina and Homoptera. (All claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Photorhabdus sp. insecticidal protein toxins and DNA encoding them can be genetically engineered into insect larvae food and plants for insect control

primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisserial bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /*tag= a

                                                                                                                                                                            The DNA fragment encoding carboxyl esterase (CE) in B.subtilis Thai 18 (CBS 679.85) (Bell-HindIII fragment of 2kb originating from pNAPT-2 (see EP-233656)) was cloned into vector pT218R. Single-stranded DNA was prepared and subjected to oligonucleotide directed mutagenesis. Eleven different mutagenesis reactions were performed in order to substitute the 11 yaine residues of CE one at the time by a glutamine residue. The resulting mutant esterase was produced in E.coli DHI (ATCC 33849) and tested for stability in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               presence of (S)-naproxen. The wild type enzyme is encoded by a DNA at least 70% homologous with this sequence (NNN-Lys in the wild type.) and is itself 70% homologous to the B. subtilis esterase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human adenosine Al receptor antisense oligonucleotide fragment.

The present sequence is that of open reading frame (ORF) mtbn6 (partial) of Mycobacterium tuberculosis. This is 1 of 8 ORFs (see 480135-42) identified as being present in the genome of M. tuberculosis but absent from the genome of the BCG strain of Mycobacterium bovis. The proteins encoded by these ORFs, i.e. Mysul-8 (see B19842-49) represent reagents that are useful in discriminating between M. tuberculosis and BCG and, in particular, for diagnostic methods which discriminate between exposure of a subject to M. tuberculosis and vaccination with BCG. The invention features these WTBN polypeptides, functional fragments of them, DNA encoding them, vectors, transformed cells, and diagnostic, therapeutic, and prophylactic (vaccine) methods, including genetic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes antisense oligonucleotides (X52869-X55271)
directed against at least 2 mRNAs selected from target genes, coding and
non-coding regions of RNAs corresponding to target genes, gene
initiation codons, genomic flanking regions, intron-exon borders, the
initiation codons, genomic flanking regions, intron-exon borders, the
5'-end, the 3'-end and the juxta-section between coding and non-coding
regions and all segments of RNAs encoding proteins associated with one
or more diseases, conditions or mixtures. The antisense oligonucleotides
may be derived from sequences X5572-74. These multiple target
oligonucleotides (specifically X5180-271) can be used for the antisense
treatment of diseases and conditions. Typical diseases and conditions
are those associated with impaired respiration and inflammation,
allergic rhinitis, acute asthma, allergies, asthma, impeded respiration,
allergic rhinitis, acute asthma, allergies, asthma, impeded respiration,
crespiratory distress syndrome, pain, cystic fibrosis, pulmonary
preferension, pulmonary vasoconstriction, employsema, chronic obstructive
pulmonary disease (COPD), and cancers such as leukemias, lymphomas,
carcinomas e.g. colon cancer, breast cancer, lung cancer, pepatic
metastassized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

This DNA sequence comprises Mycobacterium bovis BCG deletion sequence BCGdeltal. A specific genetic deletion of this region results in an avirulence phenotype of the mycobacterium. 2 other deletion regions (see T35353) have also been detected. Identification involved screening a BCG cosmid library with a radiolabeled probe obtained following DNA subtraction between virulent Mycobacterium tuberculosis H37Rv and avirulent BCG. The deletions provide useful markers for the identification of an virulent, or a virulent, mycobacterial phenotype. Determination of avirulence requires the detection of the presence or absence of the deletion; the deletions are detected either by detecting the presence or absence of deletion junctions (see T3358-46), or by checking the presence or absence of absence of the sequences contained within the deletion. Deletion polypeptides are used as components of immunological assays and in vaccines.
                                                                                                                                                                                                                                            Detecting markers for avirulence in Mycobacterium - used in production of vaccines against bacterial infection, and to detect bacterial infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 16885 BP; 3050 A; 5603 C; 5307 G; 2915 T; 10 other;

Sequence 16, Application US/08390878

Patent No. 5706633

GENERAL INFORMATION:
APPLICANT: Maharins, Charles K.
APPLICANT: Mahairas, Gregory G.
ATITLE OF INVENTION: VIRULENCE-ATTENUATING GENETIC DELETIONS
NUMBER OF SEQUENCES: 18
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Length 431;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Indels
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  78;

Patent No. 6177086

GENERAL INFORMATION:
APPLICANT: Riley, Lee W.
APPLICANT: Riley, Lee W.
APPLICANT: Birt, Sabine
TITLE OF INVENTION: DNA MOLECULE CONFERRING ON MYCOBACTERIUM
TITLE OF INVENTION: TUBERCULOSIS RESISTANCE AGAINST ANTIMICROBIAL REACTIVE
NUMBER OF SEQUENCES: 13
CORRESPONDENCE ADDRESS:
ADDRESSEE: Nixon, Hargrave, Devans & Doyle LLP
STREET: Clinton Square, P.O. Box 1051
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7930 cceceeeeeeeearcecarreeecretrearrereaceaareceeccaaecreaceere 7989

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDGP). The BOGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Karutoyo Osoegawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2: cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Submitted (02-JUN-1999) Genoscope - Centre National de Sequencage
